Claim Amendments

This listing of the claims will replace all prior versions, and listings, of claims in the application:

Claim 1 (original): A method for determining a position of a printing image on a piece of printed material in a printing machine, which comprises the steps of acquiring, by a first optical sensor, a mark disposed on the piece of printed material; acquiring, by a second optical sensor, an edge of the piece of printed material; and calculating, by an evaluation unit, a spaced distance of the mark from the edge.

Claim 2 (original): The method according to claim 1, which includes comparing the spaced distance of the mark, which has been calculated by the evaluation unit, with a prescribed nominal spaced distance, and emitting an output signal if the calculated spaced distance deviates from the nominal spaced distance by more than a prescribed value.

Claim 3 (original): The method according to claim 2, which includes forming the output signal as a positioning signal, and feeding the positioning signal to an adjustment device for controlling positioning organs for determining the position of the piece of printing material in the printing machine.

Claim 4 (original): The method according to claim 1, which includes moving the piece of printed material past the first and the second optical sensor in a prescribed direction of motion and with a predetermined velocity, determining the spaced distance between the first and the second optical sensor in the direction of motion, determining the time span between acquiring the edge and acquiring the mark, and calculating a spaced distance of the edge from the mark, from the time span, the spaced distance between the optical sensors, and the velocity.

Claim 5 (original): The method according to claim 1, which includes acquiring, by a third and a fourth optical sensor, an additional mark and the edge of the piece of printing material in vicinity of a side edge thereof disposed opposite the first and the second optical sensor, determining the spaced distance of the additional mark from the edge of the piece of printed material, comparing the spaced distance of the mark from the edge with the spaced distance of the additional mark from the edge, and emitting an output signal if the spaced distance of the mark from the edge and the spaced distance of the additional mark from the edge deviate from one another by more than a prescribed value.

Claim 6 (original): The method according to claim 1, which includes storing the spaced distance of the mark from the edge of a plurality of pieces of printed material, and determining a mean value for the spaced distance of the mark.

Claim 7 (original): The method according to claim 1, which includes providing as the mark a reference mark for adjusting partial printing images.

Claim 8 (original): The method according to claim 1, which includes storing the spaced distance for taking it into account in a further processing of the piece of printing material.

Claim 9 (previously presented): The method according to claim 1, which includes taking over a target spacing of the mark from the edge of the sheet from a printing pre-stage.

Claim 10 (original): Monitoring device for a sheet-fed printing machine, comprising a transport device for moving a piece of printing material in a prescribed direction of motion; a first optical sensor for acquiring a mark disposed on the piece of printing material, a second optical sensor for acquiring an edge of the piece of printing material; an

acquisition unit for determining the velocity of the piece of printing material; and an evaluation unit for calculating

- a. a spaced distance between said mark and said edge from the chronological spacing between acquiring said edge and acquiring said mark;
- b. at least one of the velocity and the position of the piece of printing material, and
- c. the determined spaced distance between said first and said second optical sensor, said spaced distance being parallel to the direction of motion of the piece of printing material.

Claim 11 (original): The monitoring device according to claim 10, including a data storage unit for storing therein, by said evaluation unit, spaced distances of a plurality of pieces of printed material, said evaluation unit serving for calculating a mean value for the spaced distance of said mark from said edge of a plurality of pieces of printing material.

Claim 12 (original): The monitoring device according to claim 10, wherein said first and said second optical sensor are disposed on one structural member or component.

Claim 13 (currently amended): The monitoring device according to claim 16, including a movement device for moving one of

said first, said second, said third, and said fourth optical sensors.

Claim 14 (currently amended): The monitoring device according to claim ~~[[16]]~~ 10, wherein ~~one of said second and said third optical sensors~~ sensor includes a first and a second transmitter disposed at a prescribed spaced distance from one another and, a receiver for monitoring an observation point disposed between said first and said second transmitter, ~~is a receiver for monitoring an observation point~~, said transmitters serving for emitting a light signal impinging on said observation point.

Claim 15 (currently amended): The monitoring device according to claim 14, including a switch ~~is provided that~~ for activating one of said first and said second transmitters.

Claim 16 (currently amended): The monitoring device according to claim 10, wherein said first optical sensor and said second optical sensor are disposed in a vicinity of a first side edge of the piece of printing material and including a third optical sensor for acquiring a further mark disposed on the piece of printing material and a fourth optical sensor for acquiring the edge of the piece of printing material disposed parallel to the first optical sensor and the second optical
